Stephen Smith ELEC 385, Section 01 Dr. Marino 20 February 2015

Homework #5

Test Description:

In order to test both the addition and subtraction of my small ALU, I performed the following operations with both operations (in base 10 here):

```
2+3
-1+2
127+1
-1+ (-1)
-128-1
2-3
2-(-1)
```

These tests for these operations cover the overflow and wrap around inherit with a finite number of bits to represent numbers. To test the greater-than-or-equal to and equal-to operations I performed the following tests (in base 10 here):

The results had to be output to a text file that I then took a screenshot of because the list would not show all of the tests otherwise. They are on the next page.
